Why did Helsinki close its last coal power plant?

Helsinki has officially closed its last coal power plant, cutting the city's carbon emissions by 30 percent and marking a key milestone in Finland's green transition.

Is energy production still based on fossil fuels in Helsinki?

"Energy production is no longer based on fossil fuels in Helsinki," the company says. "Helen's investments in carbon-neutral production, such as Europe's largest electric boiler plant and the world's largest heat pump, have enabled Helen to move away from coal completely.

How is Helsinki heating distributed?

Instead, Helsinki's heating is now distributed across several technologies. Helen has invested in electric boilers, heat pumps, energy storage and sustainably sourced bioenergy. Key installations include Europe's largest electric boiler and the world's largest heat pump, both used to harness waste and environmental heat.

What makes Helsinki a sustainable heat producer?

The sustainable heat production of Helsinki is built on multiple sources that are based on a flexible district heating network. The water flowing in the district heating network can be heated in countless different ways.

HELSINKI, April 1 (Reuters) - Finland's last coal-fired power and heat plant in active production will shut down permanently on Tuesday, enabling Helsinki energy group Helen to cut its...

Above all, we focus on the safety operation challenges for energy storage power stations and give our views and validate them with practical engineering applications, building ...

In 2023, the results became tangible when the Hanasaari power plant, which had served the residents of Helsinki for nearly 50 years, was decommissioned. With the decommissioning of ...

The City's energy production will no longer be based on fossil fuels. Going forward, the City will transition into electrified energy ...

HELSINKI, April 1 (Reuters) - Finland's last coal-fired power and heat plant in active production will shut down permanently on Tuesday, enabling ...

The status of these energy storage technologies in Finland will be discussed in more detail in the next sub-sections, giving a better understanding of the current and potential ...

The City's energy production will no longer be based on fossil fuels. Going forward, the City will transition into electrified energy production based on heat pumps utilising waste ...

The Salmisaari power plant ceased operations on 1 April, ending more than a century of coal use in the Finnish capital. The closure ...

Finnish energy company shuts its last coal-fired power plant, ending coal use in the capital Helsinki and putting Finland on the brink of eliminating coal entirely.

As power system technologies advance to integrate variable renewable energy, energy storage systems and smart grid technologies, improved risk assessment schemes are ...

Finnish energy company shuts its last coal-fired power plant, ending coal use in the capital Helsinki and putting Finland on the brink of ...

The Salmisaari power plant ceased operations on 1 April, ending more than a century of coal use in the Finnish capital. The closure is expected to reduce Helsinki's carbon ...

This article explores the latest investment patterns, technological advancements, and regulatory developments shaping the city's energy storage projects, with specific data on battery storage ...

A review of the current status of energy storage in Fi This is an electronic reprint of the original article. This reprint may differ from the original in pagination and typographic detail.
