Can TRNSYS model a focused solar heating system with phase change thermal storage?

In this paper, TRNSYS is used to model a focused solar heating system containing phase change thermal storage. In this case, the oil pump power is controlled by PID (Type23 module) to ensure that the heat transfer oil outlet temperature is within the specified range.

How to design a solar thermoelectric generator?

The conventional route to design a STEG involves separate considerations of thermal engineering and materials science by using a thermal boundary condition of constant heat flux. This paper provides a more direct and convenient way to design solar thermoelectric generators.

Can a solar system have a phase change storage device?

Aghbalou et al. (2006) constructs a Solar System with a phase change storage device by making sheets of phase change material and then placing them in a thermal storage tank for hybrid thermal storage.
