Why should you choose a Bess energy storage system?

The mobility and flexibility of the system enables novel applications and deployments where BESS previously were unused due to the non-flexible solutions. The system is modular, meaning that the energy storage capacity can be quickly adapted depending on the application case, in contrast to larger and bulkier solutions.

How much power does a Bess have?

The system is built of two main blocks. The PCS building block, responsible for the main control of the mobile BESS. The nominal power rating of the PCS block is 225 kVA, with a maximum peak power in the peak shaving mode of 275 kW. The second block is the modular battery pack.

What is a power utility communication standard?

A result of nearly a decade of work within the IEEE on power utility communication. The origins of the standard arise from utility work within protection, control and monitoring of substations. Over the years, the standard has developed to also cover measurements, such as statistical and historical data and power quality.

Which communication interfaces are compatible with a mobile Bess?

The investigation compares the identified communication interfaces and their respective applicability to a mobile BESS, specifically the VMS. For specific power utility applications, it is clearly noted that the standard IEC 61850 allows clear benefits compared to the other investigated interface.
